

Predictable recoverability for African customers

Veeam Software recently announced that ContinuitySA has selected Veeam Availability Suite to help deliver dependable disaster recovery and business continuity solutions as a fully managed service with predictable recoverability for its customers across industry sectors. Headquartered in Johannesburg, ContinuitySA's client base consists mainly of large and listed organisations, government departments, and the in-country operations of multinational organisations. It operates the continent's biggest network of recovery centres, with more than 20 000 m² of space in Gauteng, the Western Cape, and KwaZulu-Natal in South Africa, as well as in Botswana, Mozambique, Kenya, and Mauritius. From a business perspective, ContinuitySA customers can deliver on their strategic mandates while Veeam manages their replication and data availability needs. Veeam is an enabler for effective business growth by allowing the internal resources of companies to be repurposed for innovative product development and services delivery. Most of ContinuitySA's customers have stringent service level agreements (SLAs) and availability requirements in place. Downtime on critical systems during essential times could result in significant financial and reputational damage if recovery does not happen quickly enough.
