## Health and safety managers are in high demand in South Africa

Why business owners are tak-ing occupational health and safety more seriously now than ever before. In the next five years, inspec-tors from the government's Department of Employment and Labour will visit 389 000 work-Labour will visit 389 000 work-places across South Africa. Employment and Labour minister Thulas Nxesi announced in May that the inspections formed part of the state's programme to ensure compliance with labour legislation, improve workplace conditions and ultimately protect workers. Government findings show there were 36 000 compliant and 26 000 non-compliant employers in 2021, with the most common forms of non-compliance relating to gen-

non-compliance relating to gen-eral safety regulations, Covid-19 instructions, hazardous chemical regulations, environmental regula-tions and facilities regulations. tions and facilities regulations. Because the Disaster Manage-ment Act required that organi-sations implement a Covid-19 policy, they have been forced to implement health and safety management systems to en-sure they remain operational. While the worst of the pan-demic may be over, these sys-tems are now entrenched and will need to be improved on to meet legal requirements. Busimeet legal requirements. Busi-nesses can no longer simply

consider them a box to be ticked. "If an organisation does not have a policy drafted, implemented and embedded in the management system, health and safety may not be taken seriously. This can lead to an increase in incidents and injuries an increase in insurance. injuries, an increase in insurance

to inference in increase in insurance policies, reputational damage, high employee turnaround, imprison-ment and fines from the govern-ment," says Van Zyl Krause, op-erations manager for South African ISO (International Organisation for Standardisation) training and implementation specialist WWISE. The need for greater work-place safety is seeing an increas-ing number of organisations becoming certified through the ISO, which develops standards as a way of guaranteeing qual-ity, safety and efficiency. Currently, health and safety management systems based

on the requirement systems based on the requirements of ISO 45001:2018 are in high demand. "The ISO 45001:2018 standard requires an organisation to ard requires an organisation to include the statutory and regula-tory requirements in the system as well as the evaluations that are required to be done to ensure compliance with the legislative requirements. By implementing management systems based on the requirements of ISO 45001:2018, organisations are measured and the organisations are measured and

tested on an international level." Krause explains. Within ISO 45001:2018 are a number of clauses

are a number of clauses that are pertinent to the establishment and effec-tiveness of the system: · Clause 4 establishes the scope of the manage-ment system, identifying interested parties and the associated risks, ds well as the organisation's inter-nal and external issues; · Clause 5 addresses how top management can ensur

top management can ensure that a process for consulthat a process for consul-tation and participation with workers is established. Leadership, commitment and active support from top management are critical for the success of the health and safety management system and for the achievement and for the achievement of its intended outcomes. This can be done by ensur-ing necessary resources are available, workers and other relevant stakeholders are encouraged to participate in the process, and making sure controls are practical and proportionate to the risks; Clause 6 requires an organisation to identify and address health and safety risks, and opportunities. and for the achievement

address health and safety risks, and opportunities. The standard has specific requirements to consider when identifying haz-ards, such as infrastruc-ture, equipment, materi-als, and substances; and Clause 8 covers the specific hierarchy of con-

specific hierarchy of con-trol to be considered when implementing preventative measures. The Cape Town International Convention Centre (CTICC), one of the largest convention centres in Africa, has effectively im-plemented ISO 45001:2018 to ensure the health and safety of staff, visitors, clients and suppliers. CTICC project coor-dinator Lugmaan Vallie, says ISO 45001 provides a framework that offers the team guidance on how to prevent work-related in-juries and ill-health, while actively improving its health

juries and ill-health, while actively improving its health and safety performance. "An employee representa-tive from each department has been selected to conduct internal audits. They follow the recommended guidelines and conduct internal ISO and conduct internal ISO 45001: 2018 audits across all departments. The results are used to see whether or not staff members are carrying out the stated objectives, and that relevant policies and documentation that support the operation of a system are in order and accessible. The employees also at-tended an ISO 45001:2018

tended an ISO 45001:2018 internal auditing course. "The benefit is that em-ployees can now do internal audits (which are a require-ment of the standard) in-house instead of contracting external firms to conduct such. The employee repre-sentatives also have differ-ent perspectives inherent to their core function, and thus specific occupational health and safety observations can be addressed promptly."

be addressed promptly." South African end-to-end online learning solution pro-vider New Leaf Technologies says training of employees to undertake internal au-dits and other tasks in the

health and safety space has become all-important. To this end, targeted and dynamic online training strategies are being used to focus on individual health and safety learners or groups, resulting in greater learn-ing and retention, less time in training, and ultimately, more effective health audi-tors and practitioners. "There are quantifiable metrics that can tell you a lot about the training programme itself, and how it may be improving overall performance," New Leaf co-founder Paul Hanly says. "What we ultimately aim to create through online training programmes are organisational cultures. They aid the implementa-tion of ISO 45001:2018 and thus reinforce health and safety in the workplace."

thus reinforce health and safety in the workplace." For Krause, the ben-efits of ISO 45001:2018

"Organisations can expect a reduction in the incident requency rate, more specific risk assessments, employee participation, reduction in insurance cost, an im-proved health and safety

proved health and safety culture, increased employee morale, and decrease in illness to name a few. "They will also see a reduc-tion in the supplier on-boarding process, as clients can verify the compliance and good safety measures when presented with the ISO 45001:2018 certificate. Furthermore, they can gain more clients, as some have a requirement that suppli-ers must be certified." ers must be certified.
