

Car colour affects premium

The most popular car colour on South Africa's roads is white: 45% of the cars financed in South Africa are white, with silver coming in at nearly 25%.

While brighter colours, like pink and gold, may affect your ability to resell the car, does the colour of your car affect your insurance premium?

King Price Insurance's client experience partner, Wynand van Vuuren, said colour does affect your premium.

Van Vuuren said it is all about how visible your car is on the road, and how that affects your chances of being in an accident.

Navy, black and darker vehicles are slightly more expensive to insure, because they are harder to see on the road, and therefore have a statistically higher chance of being in an accident.

"Our claims history has shown that 'less visible' cars have a higher chance

of being in an accident. A charcoal or black vehicle will have a higher chance of being written off, and that gets priced into your premium," said Van Vuuren.

By the same token, white and light-coloured cars attract lower premiums, as they have the best visibility. Your premium may be affected by up to

10%, depending on the colour of your car. Metallic paints can also attract an extra premium, as they are more expensive to repair in the case of an accident.

The factors that insurers look at when calculating your premium include:

- The make and model of the car.
- Where you park your car during the day, and at night.
- Your driving experience and claims history.
- The 'visibility' of the car on the roads.

Good news for owners of darker cars is that the colour of your car is not a factor when it comes to theft and hijackings. Here, it's purely the make and model the thieves are after, said Van Vuuren.

So, think carefully before you buy that outrageous purple dream machine. It may just end up costing you more on your insurance premium.
